FACT SHEET
 12/2021

Recommended minimum investment horizon:

Investment Objective

A mixed fund tapping into three performance drivers: international bonds, international equities and currencies. At least 50% of its assets are invested in fixed income products and money market instruments at all times. Its flexible allocation aims to mitigate capital fluctuation while seeking the best sources of return. The Fund aims to outperform its reference indicator over 3 years.

Fund Management analysis can be found on P.4

FUND MANAGEMENT ANALYSIS

Market environment

Intervention by the US and European central banks set the tone for the month. The Federal Reserve announced slower, but nonetheless high, growth for the coming years along with inflation that, far from being temporary, will probably become a more lasting feature of the US economy. This would explain a quicker-than-expected tapering of its asset buying, to go with further rate hikes over the next two years. The ECB has said that it wants to reduce its bond buying, setting a timeline for the PEPP's withdrawal, and focus more on a more traditional method: the APP. However, it insisted that it is not looking to raise interest rates in 2022. Although the health situation has deteriorated with the spread of the Omicron variant, its apparently lower mortality rate has kept up investors' morale. Equity markets continued their ascent and these conditions pushed core yields upwards, an additional factor being the low volume of bond redemptions at the end of the year. "Risky" bonds held up well.

Performance commentary

The Fund posted a negative performance. Our equity investments suffered from exposure to certain innovative growth segments such as biotechnology and software (Wuxi Biologics, Biontech, Salesforce). Generally speaking, some innovative companies having decent growth but not yet showing high profitability, including certain fintechs, were punished. Temporarily, it may be hard for investors to assess the potential growth of a company – as innovative and promising as it may be – when inflation is rising and central banks are reducing their monetary stimulus. Our Chinese exposure also weighed on performance. Our equity derivatives had a negative impact (-0.13%). The Fund's bond component received a little help from its interest rate (+0.10%) and currency (+0.05%) derivatives. Our high yield credit performed well, as did our short derivative positions on the long end of the German curve.

Outlook and Investment strategy

The Fund reduced its equity exposure slightly in December. Although we think that the global economy will continue to reopen in 2022, growth will probably slow over the year. The global economy is facing a number of headwinds (rise in commodity prices, liquidity squeeze on both emerging and developed markets, less generous fiscal stimulus). Against this backdrop, we adjusted the equity portfolio by closing positions in certain rapidly growing but highly priced companies, in favour of more defensive names, especially in healthcare and consumer staples. We are keeping a liquid portfolio of investments based on strong convictions about innovation, diversified across regions and sectors, and fitting in with our disruption themes. We are taking a cautious stance with the fixed income component, having lowered modified duration to around 0.5bp. This is comprised of long positions on credit and emerging market debt, offset by short positions on core US and German yields.

GLOSSARY

Alpha: Alpha measures the performance of a portfolio compared to its reference indicator. Negative alpha means the fund performed less well than its reference indicator (e.g. if the indicator increased by 10% in one year and the fund increased by only 6%, its alpha is -4). Positive alpha means the fund performed better than its reference indicator (e.g. if the indicator increased by 6% in one year and the fund increased by 10%, its alpha is 4).

Beta: Beta measures the relationship between the fluctuations of the net asset values of the fund and the fluctuations of the levels of its reference indicator. Beta of less than 1 indicates that the fund "cushions" the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index falls by 10%). Beta higher than 1 indicates that the fund "magnifies" the fluctuations of its reference indicator (beta = 1.4 means that the fund increases by 14% when the index increases by 10% but also decreases by 14% when the index decreases by 10%). Beta of less than 0 indicates that the fund reacts inversely to the fluctuations of its reference indicator (beta = -0.6 means that the fund falls by 6% when the index increases by 10% and vice versa).

Capitalisation: A company's stock market value at any given moment. It is obtained by multiplying the number of shares of a company by its stock exchange price.

Duration: A bond's duration is the period beyond which interest rate variations will no longer affect its return. The duration is like a discounted average lifetime of all flows (interest and capital).

ESG: E for Environment, S for Social, G for Governance

ESG score Calculation: Only the Equity portion of the fund considered. Overall Fund Rating calculated using MSCI Fund ESG Quality Score methodology: excluding cash and non ESG-rated holdings, performing a weighted average of the normalized weights of the holdings and the Industry-Adjusted Score of the holdings, multiplied by (1+Adjustment%) which consists of the weight of positively trending ESG ratings minus the weight of ESG Laggards minus the weight of negatively trending ESG ratings. For a detailed explanation see "MSCI ESG Fund Ratings Methodology", Section 2.3. Updated April 2020.

FCP: Fonds commun de placement (French common fund).

High yield: A loan or bond rated below investment grade because of its higher default risk. The return on these securities is generally higher.

Investment grade: A loan or bond that rating agencies have rated AAA to BBB-, generally indicating relatively low default risk.

Investment/exposure rate: The investment rate constitutes the volume of assets invested expressed as a percentage of the portfolio. Adding the impact of the derivatives to this investment rate results in the exposure rate, which corresponds to the real percentage of asset exposure to a certain risk. Derivatives can be used to increase the underlying asset's exposure (stimulation) or reduce it (hedging).

Modified duration: A bond's modified duration measures the risk attached to a given change in the interest rate. Modified duration of +2 means that for an instantaneous 1% rate increase, the portfolio's value would drop by 2%.

Net asset value: Price of all units (in an FCP) or shares (in a SICAV).

Rating: The rating measures the creditworthiness of a borrower (bond issuer). Ratings are published by rating agencies and offer the investor reliable information on the risk profile associated with a debt security.

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of this return. It thus shows the marginal return per unit of risk. When it is positive, the higher the Sharpe ratio, the more risk-taking is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio posted a negative performance, but rather that it performed worse than a risk-free investment.

SICAV: Société d'Investissement à Capital Variable (Open-ended investment company with variable capital)

VaR: Value at Risk (VaR) represents an investor's maximum potential loss on the value of a financial asset portfolio, based on a holding period (20 days) and confidence interval (99%). This potential loss is expressed as a percentage of the portfolio's total assets. It is calculated on the basis of a sample of historical data (over a two-year period).

Volatility: Range of price variation of a security, fund, market or index, which enables the measurement of risk over a given period. It is determined using the standard deviation obtained by calculating the square root of the variance. The variance is obtained by calculating the average deviation from the mean, which is then squared. The greater the volatility, the greater the risk.

Yield to Maturity: Yield to maturity corresponds to the concept of actuarial yield. It is, at the time of calculation, the rate of return offered by a bond in the event it is held until maturity by the investor.

Main risks of the fund

Equity: The Fund may be affected by stock price variations, the scale of which is dependent on external factors, stock trading volumes or market capitalization. **Interest rate:** Interest rate risk results in a decline in the net asset value in the event of changes in interest rates. **Credit:** Credit risk is the risk that the issuer may default. **Currency:** Currency risk is linked to exposure to a currency other than the Fund's valuation currency, either through direct investment or the use of forward financial instruments. The Fund presents a risk of loss of capital.
